

5 ways cats' eyes are amazing

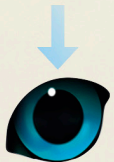

Petplan®

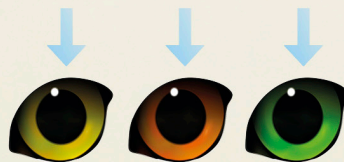

1. Changing colours

2 weeks old
In the early days of its life, every cat has blue eyes

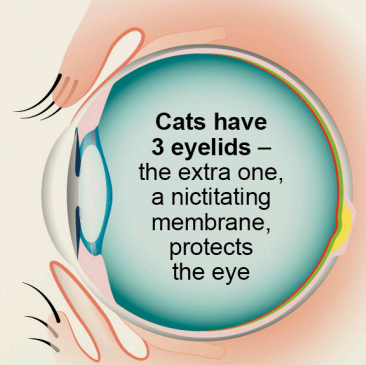

6-7 weeks old
As an adult, a cat's eye colour develops into amber, green, brown... or another wonderful shade!

Did you know?
Some cats naturally have odd-coloured eyes, known as heterochromia

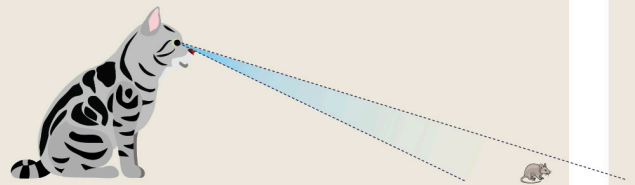

2. An extra eyelid!

Cats have **3 eyelids** – the extra one, a nictitating membrane, protects the eye

3. Perfect for hunting

Cats' vision is clearest when viewing objects around 6 metres away – close enough to nab that mouse

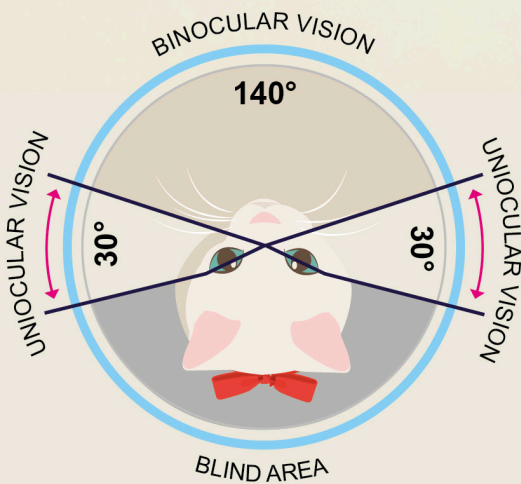

4. Nifty at night

A cat's night vision is 8 times better than ours, thanks to huge numbers of 'rod' cells, which allow eyes to detect things in low light

5. Super wide sight

Cats have 200° vision – 20° wider than a human's. This helps them spot what's approaching from the side, and they're also more sensitive to fast movements

Every pet deserves
